List of internal LATEX2e Macros useful to Package Authors

Compiled by Martin Scharrer martin@scharrer-online.de

Version 0.4 – July 23rd 2011

Abstract

This document lists the internal macros defined by the IATEX2e base files which can be also useful to package authors. The macros are hyper-linked to their description in *source2e*. For this to work both PDFs must be inside the same directory.

This document is not yet complete in content and format and may miss some macros.

1 Constants

1.1 Number Constants

Some of the following integer values are defined using \countdef (for -1), \chardef (for values between 0–255) and \mathchardef (> 255). They are robust and do not expand in an \edef context. When used on the right side of an assignment the act the same way as a count register. The \moneq mone is a real count register and can still be modified, but doing so would certainly break various code. In the terms defined by $The\ TeXbook$, this integer constants yield $internal\ integers$ rather than $integer\ denotations$.

The other numbers are defined as normal macros, which will simply expand to the containing number. They were defined to be used to set font sizes, which explains the non-integer numbers. Please note that if they are used for an assignment or other numeric context (e.g. \int num) TeX will keep expanding the following tokens until a non-numeric token is found.

Macro	Value	Defined using	,	Macro	Value	Defined using
\@ne	1	chardef		\@vpt	5	def
\tw@	2	chardef		\@vipt	6	def
\thr@@	3	chardef		\@viipt	7	def
\sixt@@n	16	chardef		\@viiipt	8	def
\@xxxii	32	chardef		\@ixpt	9	def
\@cclv	255	chardef		\@xpt	10	def
\@cclvi	256	mathchardef		\@xipt	10.95	def
\@m	1000	mathchardef		\@xiipt	12	def
\@M	10000	mathchardef		\@xivpt	14.4	def
\@Mi	10001	mathchardef		\@xviipt	17.28	def
\@Mii	10002	mathchardef		\@xxpt	20.74	def
\@Miii	10003	mathchardef		\@xxvpt	24.88	def
\@Miv	10004	mathchardef				
\@MM	20000	mathchardef		\m@ne	-1	countdef

1.2 Dimension Constants

The following dimension and skip constants are defined using registers. They must not be changed.

Macro	Value	Defined u	sing	Notes	
\p@	1pt	newdimer	1		used as a replacement of pt be- umber due to the resulting mul- n
\z@	$0 \mathrm{pt}$	newdimen	ı	Can be u	sed both for 0pt and 0
\maxdimen	16383.99999pt	newdimen	1	Largest v	ralid dimension
Macro		Value	Defi	ned using	Notes
\z@skip \hideskip \@flushglu	-	minus0pt plus 1fill t plus 1fil	news news	skip	negative but can grow

1.3 String Constants

The following macros hold common strings and are fully expandable. Some special characters are defined here as their verbatim ASCII representation. This makes them useful if such characters are to be written into an auxiliary file.

Macro	Value	Note
\space	One space	An explicit space (catcode 10 "space").
\@spaces	Four spaces	Contains 4×\space.
\empty	Empty string	Commonly used to define empty macros using \let.
\@empty	Empty string	Same as above. Used by the LATEX kernel commands.
\@backslashchar	"\"	Backslash with catcode 12 (other), i.e. simple ASCII backlash usable in e.g. \write.
\@percentchar	··•/; [*]	Percent character with catcode 12 (other), i.e. simple ASCII percent usable in e.g. \write.
\@charlb	"{"	Left brace with catcode 11 (letter).
\@charrb	"}"	Right brace with catcode 11 (letter).
\@clsextension	"cls"	Used for comparison with \@currext.
\@pkgextension	"sty"	Used for comparison with \@currext.
\@depth	"depth"	Used for box size declarations (\hb@xt@).
\@height	"height"	Used for box size declarations.
\@width	"width"	Used for box size declarations.
\@minus	"minus"	Used for skip declarations.
\@plus	"plus"	Used for skip declarations.

1.4 Token Constants

The following macros are defined using $\label{eq:macro} = \langle token \rangle$ and therefore equal to this token. They are useful for $\$ comparisons with tokens read by $\$ let or $\$

Name	Token	Catcode	Note
\@sptoken	Space	10	Should not be confused with \space
\bgroup	{	1	Begin of group
\egroup	}	2	End of group

1.5 Other

Macro	Value	Defined using	Notes
\voidb@x	(void)	newbox	permanently void box register This macro is not defined. It is used to test if other macros are undefined (using \ifx) or set them to an undefined state (using \let).
\@undefined	(undef)	(undefined)	

2 Variables

2.1 Temporary Variables

The following variables are defined and used by the LATEX kernel commands as scratch registers and macros. They can be used with care, but should only be redefined inside a local group to avoid interference with other code. Care must also be taken if they are used together with external macros, which might use them as well – maybe not yet but in the next release.

Temp variable	Туре	Note
\count@	counter	
\@tempcnta	counter	
\@tempcntb	counter	
\dimen@	dimension	
\dimen@i	dimension	Marked as "global only"
\dimen@ii	dimension	
\@tempdima	dimension	
\@tempdimb	dimension	
\@tempdimc	dimension	
\@tempa	macro	
\@tempb	macro	
\@tempc	macro	
\@gtempa	macro	For temporary definitions which must be made global
\skip@	skip	
\@tempskipa	skip	
\@tempskipb	skip	
\toks@	token register	
\@temptokena	token register	
\if@tempswa	if switch	Comes with the usual setters \@tempswatrue and
		\@tempswafalse
\@tempboxa	box register	
\@let@token	'let'	Used by \@ifnextchar to temporary store the next
		token using \futurelet. Can be used for similar pur-
		poses.

2.2 Dimension Variables

Macro	Description
\@wholewidth	This dimen register holds the half line width (thickness) in picture environments.
\@halfwidth	This dimen register hold the full line width (thickness) in picture environments.

2.3 String and Other Variables

Macro	Description		
\@currext	Extension of the current package or class file, empty outside.		
\@currname	File name base of the current package or class file, empty outside.		
\@currenvir	Name of the current environment.		
\@currenvline	Line number of the begin of the current environment		
\@currentlabel	The value a \label will point to. Set by \stepcounter and		
	\refstepcounter.		

3 Macros

3.1 Macro Definition

```
\verb|\Qnamedef{|\name|}| \langle name | list \rangle \{ \langle definition \rangle \}|
```

Defines macro $\langle name \rangle$ using $\langle def.$ Can be prefixed with $\langle long$ and $\langle global.$

```
\mbox{\nameuse}\{\langle name \rangle\}
```

Expands to macro $\langle name \rangle$.

Tests if next non-space token is equal to $\langle token \rangle$.

```
\cline{0}
```

Tests of next non-space token is '*'. Removes star for $\langle yes \rangle$ branch.

```
\dot{0}
```

Expands to $\langle cmd \rangle [\langle arg \rangle] \{\langle arg \rangle\}.$

```
\ensuremath{\texttt{O}}\
```

Tests if $\langle name \rangle$ is defined (and not equal to $\langle relax \rangle$).

```
\ensuremath{\verb{Oifdefinable}\aspace} \langle name \rangle \{\langle yes \rangle \}
```

Tests if $\langle name \rangle$ is undefined, $\langle name \rangle$ not 'relax' and doesn't start with 'end', and if $\langle name \rangle$ is not defined.

The given $\langle macro \rangle$ is marked as only be valid in the preamble. It will be redefined as an error message AtBeginDocument.

\@star@or@long

Tests for a following '*', if found \longrel@x will be let to \relax, but \long otherwise. It can the be used before \def as an potential prefix.

```
\c \c (1)
```

Short for $\operatorname{(ifnextchar[{\langle 1 \rangle}{\langle 1 \rangle}[{\langle 2 \rangle}])}$, i.e. $\langle 2 \rangle$ will be used as default argument if non was given.

```
\@protected@testopt
```

Robust version of \@testopt?

```
\verb|\addto@hook| \langle token\ register \rangle \{ \langle code \rangle \}
```

Appends code to the token register.

```
\gomegaddto@macro\langle macro\rangle \{\langle code \rangle\}
```

Appends $\langle code \rangle$ to the definition of $\langle macro \rangle$.

3.2 Expanding/Gobbling Arguments

Macro	Description
	Removes (gobbles) its argument. (long)
$\ensuremath{\texttt{Qgobbletwo}}\{\langle arg\ 1 \rangle\}\{\langle arg\ 2 \rangle\}$	Removes (gobbles) two arguments. (long)
$\ensuremath{\texttt{Qgobblefour}}\{\langle 1 \rangle\}\{\langle 2 \rangle\}\{\langle 3 \rangle\}\{\langle 4 \rangle\}$	Removes (gobbles) four arguments. (long)
\@gobblecr	Gobbles a following carriage return, ignores
	spaces otherwise
$\ensuremath{ t 0firstofone} \{\langle arg angle \}$	Expands to $\langle arg \rangle$, i.e. is used to remove braces.
	(long)
$\ensuremath{ ext{@iden}\{\langle arg angle\}}$	Identity. Same as \Offirstofone for compati-
	bility reasons. (long)
\@firstoftwo $\{\langle 1 angle\}\{\langle 2 angle\}$	Expands to $\langle 1 \rangle$, discards $\langle 2 \rangle$. (long)
\@secondoftwo $\{\langle 1 angle\}\{\langle 2 angle\}$	Expands to $\langle 2 \rangle$, discards $\langle 1 \rangle$. (long)
$\ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ $	Expands to $\langle 3 \rangle$, discards $\langle 1 \rangle$ and $\langle 2 \rangle$. (long)
$\ensuremath{\texttt{Qexpandtwoargs}}$	Expands the two arguments using \edef and
	feeds it to \macro.

3.3 Lists

```
\verb|\in0{|\langle 1 \rangle}{|\langle 2 \rangle}|
```

Checks if first argument occurs in the second and sets the switch \ifin@ accordantly. The arguments are not expanded. This must be done beforehand.

```
\verb|\ensuremath{\mathchar`|} {\langle element\rangle} {\langle list\rangle} {\langle cs\rangle} }
```

Removes an element from a comma-separated list and puts it into a control sequence.

3.4 Loops

Macro	Description
\loop \iterate \repeat	
$\ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ $	While loop with \ifnum test.
$\ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ $	While loop with \ifdim test.
$\c \c \$	While loop with $\langle switch \rangle$ test.
$\ensuremath{\texttt{Qfor}}\langle macro \rangle := \langle list \rangle \ensuremath{\texttt{do}} \{\langle body \rangle \}$	For loop. The $\langle list \rangle$ is supposed to expand to
	a comma separated list. Defines $\langle macro \rangle$ to
	each element of the list and executes $\langle body \rangle$ each
	time. Supports an empty lists without errors.
$\ensuremath{\texttt{Qtfor}}\langle macro \rangle := \langle list \rangle \\ \ensuremath{\texttt{dof}} \langle body \rangle \}$	For loop. The $\langle list \rangle$ is not expanded and taken
	as a list of tokens or $\{\ldots\}$. Defines $\langle macro \rangle$ to
	each element of the list and executes $\langle body \rangle$ each
	time. Supports an empty lists without errors.
\@break@tfor	Break out of a \@tfor loop. This should be
	called <i>inside</i> the scope of an \fi.

NOTES:

- 1. These macros use no \Otemp sequences.
- 2. These macros do not work if the body contains anything that looks syntactically to TeX like an improperly balanced \if \else \fi.

3.5 Colors

The following macros are defined equal to \relax by LaTeX2e as placeholder for the real code added by the color or xcolor package. They are needed to handle colors inside saved boxes correctly. See the definitions of \sbox for an example.

Macro	Definition given by color
\color@begingroup	\begingroup
\color@endgroup	\endgroup
\color@setgroup	\begingroup\set@color
\color@hbox	\hbox\bgroup\color@begingroup
\color@vbox	\vbox\bgroup\color@begingroup
\color@endbox	\color@endgroup\egroup

3.6 Auxiliary Macros

This auxiliary macros were originally defined to handle font changes but can be used for other code as well.

Macro	Description
$\verb \ifnot@nil{ $	Checks if $\langle 1 \rangle$ is the token \@nil. If so gobbles $\langle 2 \rangle$ otherwise uses \@firstofone to remove the braces around $\langle 2 \rangle$.
\@nil	This macro is undefined on purpose and used as end- marker in loops and other macros which process token lists.
\@nnil	Definition contains only \@nil and is used beside others to test for the presents of \@nil in \ifnot@nil. Is also used as endmarker.
\remove@to@nnil	Removes everything behind it until and including \Onnil.
\remove@star	Removes everything behind it until and including *.
\zero	Removes all spaces from $\langle text \rangle$. Expandable.
\strip@prefix	Removes everything up to and including to the next >.

3.7 Catcodes

Name	Description
\strip@prefix	Removes everything up to and including to the next
	>.
$\ensuremath{ ext{Qmakeother}}$	Changes the catcode of the letter to 'other' (12). Spe-
	cial letters must be escaped with a backslash.
\@sanitize	Changes catcodes of everything except braces to
	'other' (12).
0.00000000000000000000000000000000000	Sanitizes $\langle macro \rangle$, turns it definition into ver-
	batim code. Resulting characters except spaces
	are in catcode 'other' (12)! Uses \meaning and
	\strip@prefix. (With ϵ -TEX many applications can
	be replaced by $\detokenize{\langle content \rangle}$.)

3.8 Messages

\MessageBreak

Inside a message this macro create a new line followed by a continuation text. Outside it is equal to \relax.

```
\verb|\GenericInfo|| \langle continuation \rangle \} \{ \langle message \rangle \}
```

Prints $\langle message \rangle$ to a log file. An included \MessageBreak will cause a new line which start with $\langle continuation \rangle$.

```
\label{eq:continuation} $$ \operatorname{CenericError}_{\langle continuation \rangle}_{\langle con
```

Print error message to log file followed by the 'further information' line. The help text is displayed if the user presses 'h'.

```
\lceil \sqrt{\log \{\langle log \ message \rangle\}} \rceil
```

Write on log file only.

3.9 Dimensions, Length and Skips

Name	Description	
$\verb \coloredge \ensuremath{\verb (register) } \\ \verb \coloredge \ensuremath{\verb (dimension value) } \\$	Rounds register to whole number of points. Awaits a value dimension value $(\langle int \rangle, \langle frac \rangle pt)$ as string where the 'pt' is removed. If $\langle frac \rangle$ is numerical equal to	
$\verb \strip@pt \langle dimension \rangle$	0, then it and the decimal dot are removed as well. Expands dimension using \the and strips the 'pt' using \rem@pt.	
\@killglue	Removes (\unskips) the last and then all further skips (\lastskip) till one with a size of zero is reached.	

\@defaultunits

Used to provide a default unit for dimen or skip assignment.

Usage: \@defaultunits\dimen=#1pt\relax\@nnil. Other units can be used instead of 'pt'.

3.10 Class and Package Options

Macro	Description
\@unusedoptionlist	List of options of the main class. List of options to the main class that haven't been declared. Comma separated list of the options declared by the current
	package or class. The list is in the order in which the options were declared.

3.11 Files

Macro	Description
\if@filesw	If false the package should not be produce or write to output files.
	Set to false by \nofiles.
\if@partsw	
\@currdir	Holds the current directory, e.g. './' in an Unix OS.
\input@path	List of input paths. Each path should be enclosed in braces with
	no delimiters between paths.
\@filelist	The comma separated list of all files read so far. Only active if
	\listfiles is used in the preamble.
\@inputcheck	Input file handle to check for the existence of the file.
\@unused	Output file handle used to reserve the standard output. Used in
	\typeout to write to the terminal.
\@mainaux	Output file handle for the main aux file.
\@partaux	Output file handle for include file aux files.
\@auxout	Let to \@partaux inside include files, but to \@mainaux otherwise.
\@partlist	Holds the comma-separated list defined by \includeonly.
\@pushfilename	pushes file name, extension and current catcode of '@' onto the
	file stack.
\@popfilename	pushes file name, extension and current catcode of '@' onto the
	file stack.
\@currnamestack	file name stack.

$\verb|\filename@parse{|}\langle filename|\rangle||$

Parses \(\) filename\(\) and provides its directory, name base and extension in \filename\(\) area, \(\) filename\(\) base and \(\) filename\(\) to \(\) relax if it does not exists.

\@filef@und

The macro \IffileExists(which is used by \InputIfFileExists()) stores the found file followed by a space in this macro.

$\ensuremath{\texttt{Qstarttoc}}\ensuremath{\langle ext \rangle}$

Reads the file with the given extension ($\jobname.\langle ext \rangle$) and opens it for writing afterwards. The file is initially empty. Creates the output file handle $\tf@\langle ext \rangle$.

$\ensuremath{\verb{Qwritefile}{\langle ext \rangle}}{\langle code \rangle}$

Writes code using the output handle $\mathsf{tf0}\langle ext \rangle$ if it exists.

$\verb|\@iffileonpath{$\langle filename \rangle$}|$

Check if given file is found by T_EX directly or in any of the directories given by \input@path.

```
\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredge{\coloredg
```

Prints warning message (only) that now a different file is used a input.

```
\ensuremath{\texttt{Qaddtofilelist}\{\langle filename \rangle\}}
```

Adds the given filename to the list of files. Only active if \listfiles is used in the preamble.

```
\verb|\Qptionlist{|}\langle filename \rangle |
```

Expands the option list of package, class or file given by full filename.

```
\label{eq:condense} $$ \operatorname{\condense}_{\langle rase\rangle}_{\langle true\rangle}_{\langle false\rangle}_{\langle false
```

Tests if given package/class/file has been loaded.

```
\label{eq:continuity} $$ \operatorname{\continuity}_{\langle true\rangle}_{\langle false\rangle} $$ \operatorname{\continuity}_{\langle true\rangle}_{\langle false\rangle}_{\langle if@ptions\{\langle extension\rangle\}_{\langle option-list\rangle}_{\langle true\rangle}_{\langle true\rangle}_{\langle false\rangle}_{\langle false\rangle}_{\langle option-list\rangle}_{\langle true\rangle}_{\langle false\rangle}_{\langle false\rangle}_{\langle option-list\rangle}_{\langle true\rangle}_{\langle false\rangle}_{\langle option-list\rangle}_{\langle true\rangle}_{\langle option-list\rangle}_{\langle option-
```

Tests if given package/class/file has been loaded with the given options.

```
\label{eq:control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_co
```

Tests if given package/class/file has been loaded with a version more recent than $\langle version \rangle$.

3.12 Saved plainT_EX primitives

The following plainTEX macros are redefined by LATEX and therefore saved away first:

ĿT _E X Macro	plainT _E X original	Description/Note
\00par	\par	Some LATEX environments redefine \par locally
\@@input	\input	Syntax: $\langle filename \rangle$
\@@end	\end	
\@@underline	\underline	
\frozen@everymath \frozen@everydisplay	\everymath \everydisplay	

3.13 Fonts

Macro	Description
\f@encoding	Holds the current font encoding.
\f@family	Holds the current font family.
\f@series	Holds the current font series.
\f@shape	Holds the current font shape.
\f@size	Holds the current font size (in pt but without unit).
\f@baselineskip	Holds the current baseline skip (in pt but without unit).
\f@linespread	Holds the current internal value for \baselinestretch.
\@currsize	Let to the last font size command (e.g. \small).
\curr@math@size	Holds locally the current math size.
\curr@fontshape	f@encoding / f@family / f@series / f@shape

3.14 Paragraph

Macro	Description
\@@par	PlainT _E X primitive \par.
$\ensuremath{ ext{@setpar}}\{\langle val angle\}$	Used to make environment-wide changes to \par. Sets both \par
	and $\langle par \text{ to } \langle val \rangle$.
\@restorepar	Defines \par to \@par.

3.15 Space Hack

Macro	Description
\@bsphack	
\@esphack	Both of these macro ensure that the code between them does not insert any spaces into the document. The code itself should not produce any text and not change the mode (e.g. start or stop math mode).
\@Esphack	Variant of \@esphack which sets the @ignore switch to true which causes an \ignorespaces after the \end of the environment.
\@vbsphack	Variant of \@bsphack which ensure the invisible material is not set in vmode. Not used by LaTeX itself at the moment.

3.16 Boxes

Macro	Description
\null	Empty \hbox. Good to fill places which must
	not be empty.
\strutbox	Box with dimension of \strut, i.e. maximum
	height and depth of the current font and zero
	width. Can be used to extract this dimension
	with \ht\strutbox and \dp\strutbox.
\@arstrutbox	Defined inside array and tabular. Like
	\strutbox but stretched by \arraystretch.
$\ensuremath{\verb{QbeginQtempboxa}$\langle box\rangle${\langle content\rangle}}$	Stores $\langle content \rangle$ into $\backslash \texttt{@tempboxa}$ as $\langle box \rangle$
	(\hbox or \vbox) and stores its dimension into
	\width, \height, \depth and \totalheight.
\@end@tempboxa	Ends a \@begin@tempboxa environment.
\hb@xt@	
	\hbox to
\hmode@bgroup	\leavevmode\bgroup

 $\colon \colon \colon$

Sets the $\langle length\ register \rangle$ to the dimension given by the $\langle dimension \rangle$ (\ht, \dp and \wd) of the $\langle content \rangle$. Example: \@settodim{\wd}{\@tempdima}{Hello World} will set \@tempdima to the width of "Hello World".

3.17 Base Conversion

Macro	Description
$\verb \hexnumber@{ \langle number \rangle } $	Returns a single digit hexadecimal number $(0-9, A-F)$ from given $\langle number \rangle$, which must either be a numeric register or a number ending with a space!
$\verb \Qalph{ \langle number \rangle }$	Expands to lower case letter corresponding to the given number (1=a, 2=b,). Expands to \@ctrerr if number is larger then 26.
$\verb \QAlph{ \langle number \rangle }$	Expands to upper case letter corresponding to the given number (1=A, 2=B,). Expands to \@ctrerr if number is larger than 26.
$\verb \two@digits{ \langle number \rangle } $	Returns $\langle number \rangle$ (e.g. a count register) as string and ensures that it has at least two digits by appending a '0' if required.

3.18 Conditionals

Macro	Description
\if@compatibility	Switch to indicate if the LaTeX2.09 compatibility mode is active.
\if@ignore	Whether or not to ignore spaces after an environment. Set to true by \ignorespacesafterend.
\if@minipage	True for a minipage, false for a parbox. Responsible for adding space, skips and paragraph indents for a parbox.
\if@twoside	True for two-sided documents
\if@twocolumn	Indicates if two-column mode is active
\if@firstcolumn	Indicates if the first column is processed
